

Dr Andrew Wakefield

My data show that the jab could trigger autism.

Japanese Scientist Hideo Honda

I've studied more children. My results prove that MMR is innocent.

Who is right? Study the data and decide for yourself.

What is MMR?

The MMR jab stops us getting 3 viral diseases: measles, mumps and rubella. It contains a weak form of each virus. They can't make us ill, but we still make antibodies against them. That takes time. White cells that can make these antibodies stay in the blood. If we meet the full strength virus later, antibodies get made faster. So we can wipe out the virus before it makes us ill.

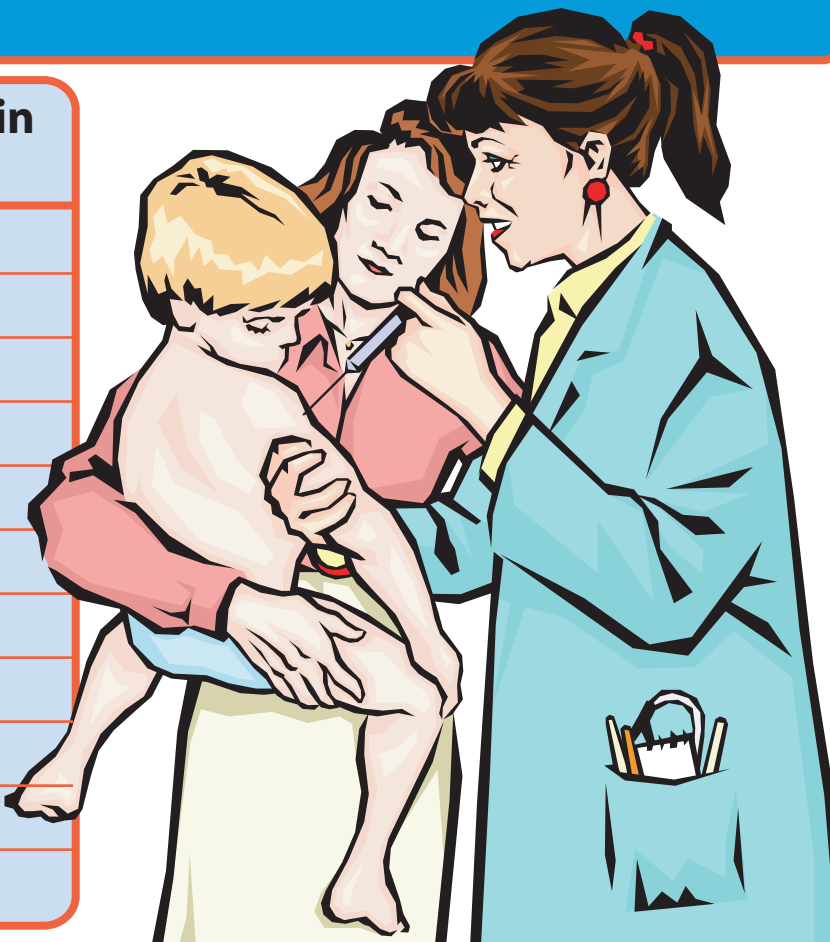

What is autism?

People with autism find it hard to make friends. They can't understand other people's emotions. The world around them can seem a complete jumble.

Dr Wakefield's data

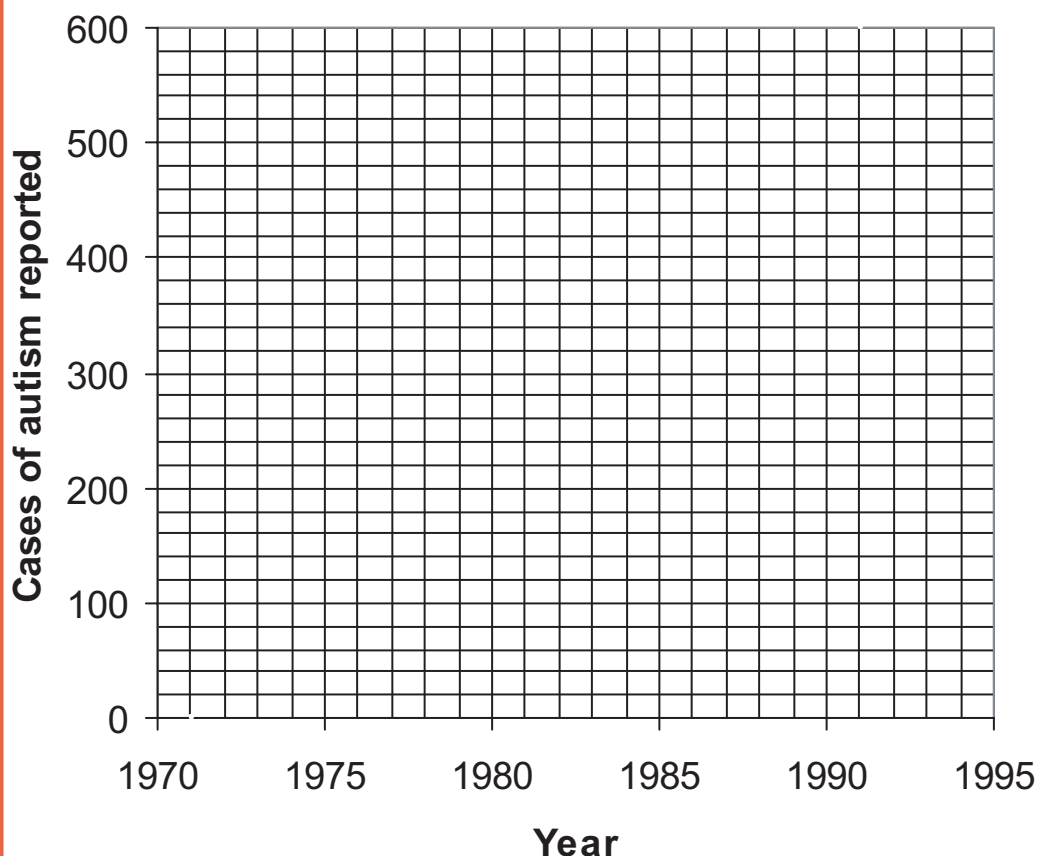

Year	Cases of autism in California USA
1971	180
1973	160
1975	190
1977	160
1979	210
1981	260
1983	290
1985	330
1987	320
1989	530
1991	550

MMR jabs started

Plot a graph and decide what the data shows

Dr Wakefield's data

The number of cases of autism....

But Dr Wakefield's data does not take account of 2 factors:

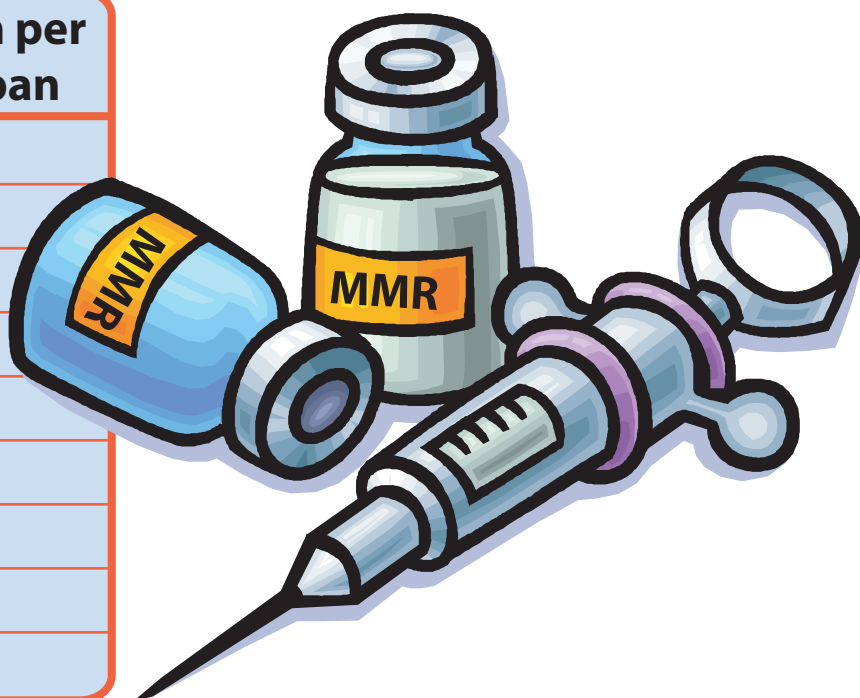

- California's population was increasing
- Since 1980, doctors have been able to detect autism in younger children

Now look at Honda's data. His study took both factors into account

Year	Cases of autism per 100,000 in Japan
1988	10
1989	15
1990	23
1991	18
1992	18
1993	19
1994	36
1995	12
1996	15

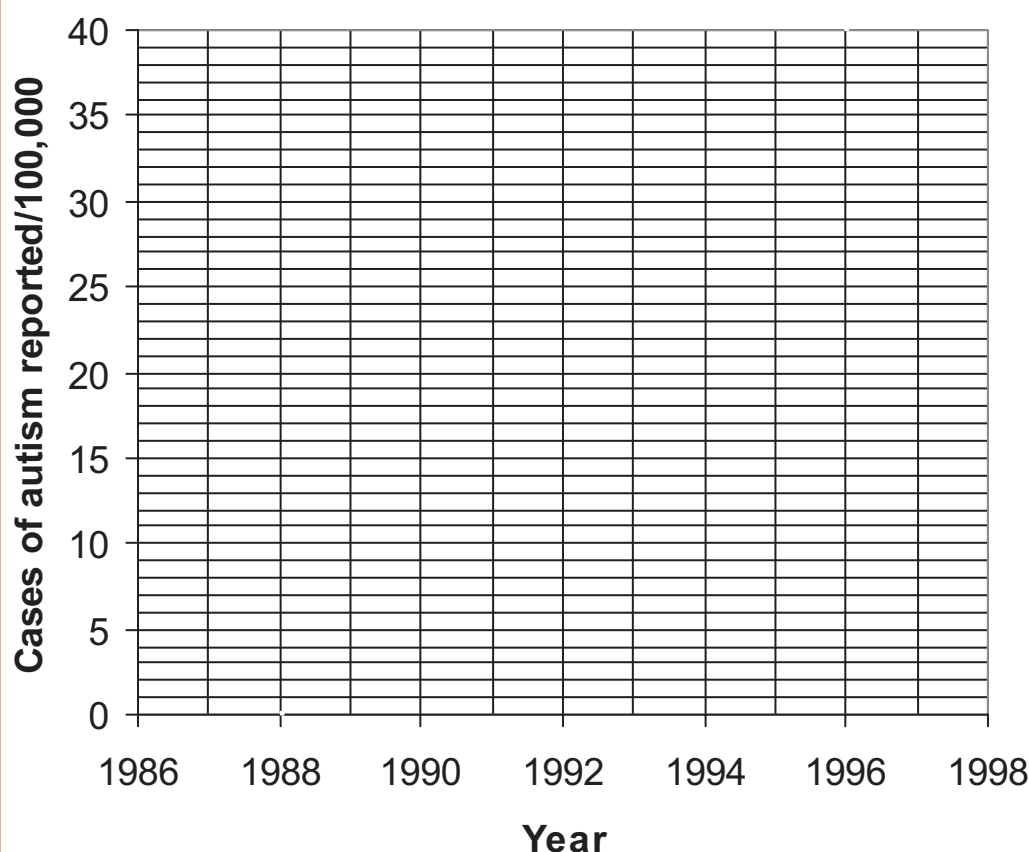

MMR jabs started

MMR jabs stopped

Plot a graph and decide what the data shows

Honda's data

Does this change the conclusions you made from Dr. Wakefield's data?

Will you vaccinate ***your*** child?
